

NEW BUILDING MATERIALS

While the commercial property owner is encouraged to use traditional materials in the reconstruction of missing or altered building elements, often it is economically infeasible. Therefore, the owner may consider using newer building materials that emulate the appearance of the traditional elements.

When designing a new storefront for your commercial property, you should meet with the Northfield Heritage Preservation Commission to determine what contemporary building materials are acceptable and available.

The traditional storefront is generally constructed of a combination of materials, such as wood framing, plywood moldings, metal flashing, and plate glass. The typical elements of the storefront were the metal-clad window crown or cornice, the wood framed transom window, the wood framed display window, and the wood or metal bulkhead. The window and bulkhead are generally set back in the storefront opening at least six inches.

The reconstructed storefront can create the same “look” using newer building materials such as insulating glass and aluminum framing. However, the proportions and placement of the different elements need to closely match the elements of the original storefront.*
